

JSP Quick Reference Card

Basic Syntax

Default scripting language

The scripting language of a JSP page defaults to Java. Insert the following line in a JSP page to configure the page to use JavaScript:

```
<%@ page language = "javascript" %>
```

Using white space

White space contained within the template code is returned to the client as it was entered in the JSP.

Quoting attribute values

Quote attribute values, using either single or double quotes, to all JSP elements. For example:

```
<%@ page contentType = "text/plain" %>
```

Writing comments for the JSP

A JSP comment is not output to the client as part of the JSP page's output.

```
<!-- Comment string... -->
```

Outputting comments to the client

HTML comments are output to the client.

```
<!-- comments -->
```

Directives

page

Defines page-wide attributes.

```
<%@ page attribute="value" ... %>
```

Attributes, with default values, are:

```
attribute = language="java" | session="true"
| contentType=text/html; charset="ISO-8859-1"
| import="package(s)" | buffer="8kb"
| autoFlush="true" | isThreadSafe="true"
| info="text_string" | errorPage="relativeURL"
| isErrorPage="true" | extends="class_name"
```

value = a string literal in single or double quotes.

include

Inserts text into a JSP page.

```
<%@ include file = "path" ... %>
```

taglib

Defines a custom tag library used by a JSP page.

```
<%@ taglib uri="tagLibraryURI"
prefix="tagPrefix" %>
```

After the taglib directive, reference the custom tags using the syntax:

```
<tagPrefix: tagName>
...
</tagPrefix: tagName>
```

Scripting Elements

declaration

Creates page-wide definitions such as variables.

```
<%! declaration %>
```

Example:

```
<%! private String foo = null;
public String getFoo() {return this.foo;} %>
```

scriptlet

Contains a block of scripting code. A JSP page can contain multiple blocks of scripting code.

```
<% script code %>
```

Example:

```
<% String greeting =
request.getParameter("Greeting");
out.println(greeting); %>
```

expression

Defines statements evaluated on the server before sending the page output to the client.

```
<%= expression %>
```

Example:

```
<%= myVar1%>
```

Actions

jsp:include

Call one JSP page from another. Upon completion, the destination page returns control to the calling page.

```
<jsp:include page="path" flush="true"/>
```

```
<jsp:include page="path" flush="true">
  <jsp:param name="paramName"
    value="paramValue" /> ...
</jsp:include>
```

jsp:forward

Calls one JSP page from another. Execution of the calling page is terminated by the call.

```
<jsp:forward page="path" />
```

```
<jsp:forward page="path">
  <jsp:param name="paramName"
    value="paramValue" /> ...
</jsp:forward>
```

jsp:plugin

Enables you to invoke an applet on a client browser.

```
<jsp:plugin
  type="bean|applet"
  code="objectCode"
  codebase="objectCodebase"
  { align="alignment" }
  { archive="archiveList" }
  { height="height" }
  { hspace="hspace" }
  { jreversion="jreversion" }
  { name="componentName" }
  { vspace="vspace" }
  { width="width" }
  { nspluginurl="url" }
  { iepluginurl="url" } >
  <jsp:params>
    { <jsp:param name="paramName"
      value="paramValue" /> }+
  </jsp:params> }
  { <jsp:fallback> arbitrary_text
  </jsp:fallback> } >
</jsp:plugin>
```

The elements in brackets ({}) are optional.

jsp:useBean

Defines an instance of a Java bean.

```
<jsp:useBean id="name"
  scope="page|request|session|application"
  typeSpec />

<jsp:useBean id="name"
  scope="page|request|session|application"
  typeSpec >
  body
</jsp:useBean>
```

typespec is any one of the following:

```
class="className" |
class="className" type="typeName" |
beanName="beanName" type="typeName" |
type="typeName"
```

jsp:setProperty

Sets the value of one or more properties in a bean.

```
<jsp:setProperty name="beanName" prop_expr />

prop_expr has one of the following forms:

property="*" |
property="propertyName" |
property="propertyName" param="parameterName" |
property="propertyName" value="propertyValue"
```

jsp:getProperty

Writes the value of a bean property as a string to the out object.

```
<jsp:getProperty name="name"
  property="propertyName" />
```

JSP Objects

See the corresponding Java object type for the available methods for these objects.

application

The servlet context obtained from the servlet configuration object.

Java type: javax.servlet.ServletContext

config

The ServletConfig object for the JSP page.

Java type: javax.servlet.ServletConfig

exception

The uncaught exception that resulted in the error page being invoked.

Java type: java.lang.Throwable

out

An object that writes into a JSP page's output stream.

Java type: javax.servlet.jsp.JspWriter

pageContext

The page context for the JSP.

Java type: javax.servlet.jsp.PageContext

request

The client request.

Java type: javax.servlet.HttpServletRequest

response

The response to the client.

Java type: javax.servlet.HttpServletResponse

session

The session object created for the requesting client.

Java type: javax.servlet.http.HttpSession
